Лабораторная работа № 3
по курсу «Компьютерные системы и сети»
«Протокол одноранговой сети»

Студент группы ИУ9-32Б Федуков А. А.

Преподаватель Посевин Д. П.

24 сентября 2024 г.

Цель работы

Целью данной работы является разработка одноранговой сетевой службы.

Задание

Краткое описание вариантов одноранговых сетевых служб, один из которых нужно раз-работать в ходе выполнения лабораторной работы, приведено в таблице с перечнем вариантов.

Основные требования к сетевой службе: 1. в качестве формата сообщений для протокола взаимодействия пиров нужно использовать JSON; 2. полная проверка данных, получаемых из сети; 3. устойчивость к обрыву соединения; 4. ведение подробного лога всех ошибок, а также других важных событий (установка и завершение соединения с соседним пиром, приём и передача сообщений, и т.п.).

Документация к протоколу должна быть оформлена в виде комментариев к структурам данных, описывающим сообщения, в исходном коде. Сетевая служба должна работать строго на боевых серверах.

Распределённый массив (кольцо) Топология: кольцевой список. Информация, известная пиру при запуске: его IP-адрес и порт, а также IP-адрес и порт следующего пира в кольцевом списке (следующий пир не обязан быть заранее запущен). Описание службы: каждый пир через стандартный поток ввода принимает команды – присвоить целочисленное значение элементу массива, вычислить сумму элементов массива на отрезке. Замечание: за каждым пиром должен быть закреплён фрагмент массива, за хранение которого пир отвечает. Замечание: за каждым пиром должен быть закреплён фрагмент массива, за хранение которого пир отвечает.

Реализация

Для создания пиринговой сети, контролируемой с дашборда, я создал несколько файлов: [main.go](#) (задание основных переменных и структур, запуск основных функций); [server.go](#) (серверная часть пирингового узла); [client.go](#) (клиентская часть пирингового узла); [httpServer.go](#) (общение с дашбордом по http);

[socketServer.go](#) (общение с дашбордом по websocket); [sseServer.go](#) (лог на дашборд); а также [start.sh](#), который собирал код, а потом запускал его. После чего при помощи [runNetwork.sh](#) я загружал файлы на сервера и запускал, управляя ими с дашборда [webClient.html](#)

Вывод

Я научился использовать tcp протокол, продолжил познавать http, а также поработал с websocket на Go. Я изучил модель пиринговой сети, передавал данные с одного сервера на другой.

44
